

Enterprise Solutions from Microsoft® and CommVault®

Over a decade ago, we (Microsoft and CommVault) sat down to map out a strategy to use Windows Server® operating systems as the foundation on which to build simple products that manage heterogeneous data for our customers. At that time, we discussed the power of the upcoming family of Windows Server editions and how CommVault could build on ever-improving Microsoft solutions, such as Microsoft Exchange Server, Microsoft® Office SharePoint® Server, the Microsoft® Office system, Microsoft® SQL Server®, Microsoft® Office Communications Server (OCS), the Microsoft® Active Directory® service, Microsoft® Hyper-V™ Server, and the Windows® File System itself.

A decade later, we look back knowing that we've accomplished a lot to make managing enterprises easier and efficient, and have now enabled our customers to microscopically manage their data at the "Content Level". However, we also realize we must continue to improve our products as businesses increasingly rely on software and computers 24 hours a day, seven days a week. For example, creating easy-to-use software that enables content management of Exchange, SharePoint, Hyper-V, OCS and File System data demonstrates the benefits of our collaboration, but we're confident there are more enhancements coming. Managing On-Line, Near-Line and Off-Line data "anywhere, anytime", helps enable businesses to meet compliance requirements. Digital Rights Management and the continuing legal procedures will place growing demands on IT Professionals, and Microsoft and CommVault are committed to helping customers meet these growing data management needs.

Yes, the past 10+ years have been productive, and the results of our collaboration have set a high standard of excellence, one that our customers rightly demand and deserve. Microsoft and CommVault are committed to making business activities easier using solutions built on Windows Server operating systems.
